Service Description

Abstract

This document provides service description for the **pull-systems** service.

1 Overview

This document describes the **pull-systems** service, which enables the systems to get system details for each system registered in Service Registry. Examples of this interaction is a dedicated core system that needs these informations.

The rest of this document is organized as follows. In Section 2, we describe the abstract message functions provided by the service. In Section 3, we end the document by presenting the data types used by the mentioned functions.

1.1 How This Service Is Meant to Be Used

The given core system is required to submit the input parameters.

1.2 Important Delimitations

Direction input parameter could be only `ASC` or `DESC` .

1.3 Access policy

Available only for the following core systems: *Plant Description Engine*

2 Service Interface

This section describes the interfaces to the service. The **pull-systems** service is used to get system details for each system registered in the Local Cloud. In the following, each subsection names an interface, an input type and an output type, in that order. The input type is named inside parentheses, while the output type is preceded by a colon. Input and output types are only denoted when accepted or returned, respectively, by the interface in question. All abstract data types named in this section are defined in Section 3.

The following interfaces are available.

2.1 interface **HTTP/TLS/JSON (QueryParams)** : **SystemListResponse**

Profile type	Type	Version
Transfer protocol	HTTP	1.1
Data encryption	TLS	1.3
Encoding	JSON	RFC 8259 [1]
Compression	N/A	-

Table 1: HTTP/TLS/JSON communication details.

3 Information Model

Here, all data objects that can be part of the **pull-system** service provides to the hosting System are listed in alphabetic order. Note that each subsection, which describes one type of object, begins with the *struct* keyword, which is used to denote a collection of named fields, each with its own data type. As a complement to the explicitly defined types in this section, there is also a list of implicit primitive types in Section 3.3, which are used to represent things like hashes and identifiers.

3.1 struct **QueryParams**

Field	Type	Mandatory	Description
direction	Direction	no	Sorting direction.
page	Number	no	Pagination page number.
size	Number	no	Pagination page size.
sortField	String	no	Field name used as the basis of the sorting.

3.2 struct **SystemListResponse**

Field	Type	Description
data	Array<Object>	List of service instances
count	Number	Size of the result list.

3.2.1 struct **data**

Field	Type	Description
address	String	Network address.
authenticationInfo	String	Public key of the client certificate.
createdAt	DateTime	System instance record was created at this UTC times-tamp.
id	Number	Identifier of the system instance
metadata	Metadata	Metadata
port	PortNumber	Port of the system.
systemName	Name	Name of the system.
updatedAt	DateTime	System instance record was modified at this UTC times-tamp.

3.2.2 struct **Metadata**

A JSON Object which maps String key-value pairs.

3.3 Primitives

Types and structures mentioned throughout this document that are assumed to be available to implementations of this service. The concrete interpretations of each of these types and structures must be provided by any IDD document claiming to implement this service.

Type	Description
Address	A string representation of the address
DateTime	Pinpoints a specific moment in time.
Direction	String representing the sorting direction.
Object	Set of primitives and possible further objects.
Name	A string identifier that is intended to be both human and machine-readable.
Number	Decimal number
