

authorization-control-subscription

Service Description

Abstract

This document provides service description for the **authorization-control-subscription** service.

1 Overview

This document describes the **authorization-control-subscription** service, which enables publish-subscribe type authorization control within a local cloud. The purpose of this service is to grant access right for a consumer to being subscribed for the events published by a specified provider.

The rest of this document is organized as follows. In Section 2, we describe the abstract message functions provided by the service. In Section 3, we end the document by presenting the data types used by the mentioned functions.

1.1 How This Service Is Meant to Be Used

Primarily the Event Handler Supporting Core System should consume this service to verify the access right of a consumer (for the given provider) at the time of its subscription and when the Event Handler receives notification from the Authorization about the fact that changes have happened in the authorization rules.

1.2 Important Delimitations

A consumer has right to subscribe for the events of a provider, when there is at least one authorization rule with the given consumer and provider.

1.3 Access policy

This service is available only for the Event Handler Supporting Core System.

2 Service Interface

This section describes the interfaces to the service. The **authorization-control-subscription** service is used to verify authorization rules. The various parameters are representing the necessary system and service input information. In particular, each subsection names an interface, an input type and an output type, in that order. The input type is named inside parentheses, while the output type is preceded by a colon. Input and output types are only denoted when accepted or returned, respectively, by the interface in question. All abstract data types named in this section are defined in Section 3.

The following interfaces are available.

2.1 interface **HTTP/TLS/JSON** (**CheckAuthSubscriptionRequest**) : **CheckAuthSubscriptionResponse**

Profile type	Type	Version
Transfer protocol	HTTP	1.1
Data encryption	TLS	1.3
Encoding	JSON	RFC 8259 [1]
Compression	N/A	-

Table 1: HTTP/TLS/JSON communication details.

3 Information Model

Here, all data objects that can be part of the **authorization-control-subscription** service provides to the hosting System are listed in alphabetic order. Note that each subsection, which describes one type of object, begins with the *struct* keyword, which is used to denote a collection of named fields, each with its own data type. As a complement to the explicitly defined types in this section, there is also a list of implicit primitive types in Section 3.6, which are used to represent things like hashes and identifiers.

3.1 struct CheckAuthSubscriptionRequest

Field	Type	Mandatory	Description
consumer	SystemDescriptor	yes	Descriptor of the consumer system.
publishers	List<SystemDescriptor>	yes	Descriptor of the publisher systems. (The output contains only the authorized publishers)

3.2 struct SystemDescriptor

Field	Type	Mandatory	Description
address	Address	yes	Network address.
authenticationInfo	String	no	Public key of the client certificate.
metadata	Metadata	no	Metadata
port	PortNumber	yes	Port of the system.
systemName	Name	yes	Name of the system.

3.3 struct Metadata

An Object which maps String key-value pairs.

3.4 struct CheckAuthSubscriptionResponse

Field	Type	Mandatory	Description
consumer	SystemRecord	yes	Descriptor of the consumer system.
publishers	List<SystemRecord>	yes	Descriptor of the authorized publisher systems.

3.5 struct **SystemRecord**

Field	Type	Description
address	Address	Network address of the system.
authenticationInfo	String	X.509 public key of the system.
createdAt	DateTime	System instance record was created at this UTC time-stamp.
id	Number	Identifier of the system instance.
metadata	Metadata	Additional information about the system.
port	PortNumber	Port of the system.
systemName	Name	Name of the system.
updatedAt	DateTime	System instance record was modified at this UTC time-stamp.

3.6 Primitives

Types and structures mentioned throughout this document that are assumed to be available to implementations of this service. The concrete interpretations of each of these types and structures must be provided by any IDD document claiming to implement this service.

Type	Description
Address	A string representation of the address.
DateTime	Pinpoints a specific moment in time.
Object	Set of primitives and possible further objects.
List<A>	An <i>array</i> of a known number of items, each having type A.
Name	A string identifier that is intended to be both human and machine-readable.
Number	Decimal number
PortNumber	A Number between 0 and 65535.
String	A chain of characters.
