Gateway Core System

System Design Description

Abstract

This document provides system design description for the **Gateway Core System**.

Version 4.6.0 Status RELEASE Page 2 (10)

Contents

1	1 Overview	3

Version 4.6.0 Status RELEASE Page 3 (10)

1 Overview

This document describes the Gateway Core System, which exists to establish a secure connection between a consumer and a provider located in different clouds.. In Section 2, we describe implementation details of the system. In Section 3, we summarize the services produced by the system.

Version 4.6.0 Status RELEASE Page 4 (10)

2 Implementation

2.1 Implementation language and tools

• Programming Language: Java 11

Programming Framework: Spring-Boot 2.1.5

• Building Tool: Maven 3.5+

Database Management System: MySQL 5.7

· State: StatelessI

2.2 Functional properties implementation

2.2.1 Database structure

The Gateway Core System does not need any data storage functionality. It only uses a database to (optional) logging.

2.2.2 Configuration

The system configuration properties can be found in the application.properties file which is located at src/main/resources folder.

Note: During the build process this file is going to be built into the executable jar, but also going to be copied next to the jar file. Any modification in the configuration file located next to the executable jar file will overide the built in configuration property value.

· sr_address

The address of the Service Registry Core System in the local cloud.

• sr_port

The port of the Service Registry Core System in the local cloud.

inactive_gateway_bridge_timeout

If a gateway tunnel is not used for a specific time, the Gateway automatically destroys it. This property specifies the maximum idle time, in seconds.

min_port

The Gateway needs a range of free ports to create access points for the consumers, This property specifies the lower bound of the port range (inclusive).

max_port

The Gateway needs a range of free ports to create access points for the consumers, This property specifies the upper bound of the port range (inclusive).

provider_side_max_request_per_socket

The Gateway can reuses the socket connection to a provider which can decrease the response times. This property specifies how many request can use the same socket connection.

Version 4.6.0 Status RELEASE Page 5 (10)

2.3 Non functional properties implementation

2.3.1 Security

The system's security is relying on SSL Certificate Trust Chains. The Arrowhead trust chain consists of three level:

- Master certificate: arrowhead.eu
- Cloud certificate: my-cloud.my-company.arrowhead.eu
- Client certificate: my-client.my-cloud.my-company.arrowhead.eu

The trust chain is created by issuing the cloud certificate from the master certificate and the client certificate from the cloud certificate. With other words, the cloud certificate is signed by the master certificate's private key and the client certificate is signed by the cloud certificate's private key which makes the whole chain trustworthy.

For Arrowhead certificate profile see https://github.com/eclipse-arrowhead/documentation

2.3.2 Access control

The services provided by Gateway Core System are applying various access policies, which are described in the related service description documents.

2.3.3 Configuration

The system configuration properties can be found in the application.properties file which is located at src/main/resources folder.

Note: During the build process this file is going to be built into the executable jar, but also going to be copied next to the jar file. Any modification in the configuration file located next to the executable jar file will overide the built in configuration property value.

· spring.datasource.url

URL to the database.

· spring.datasource.username

Username to the database.

· spring.datasource.password

Password to the database.

· spring.datasource.driver-class-name

The driver provides the connection to the database and implements the protocol for transferring the query and result between client and database.

· spring.jpa.database-platform

Specify the database dialect for Java Persistence API.

· spring.jpa.show-sql

Set to true in order to log out the mysql queries.

Version 4.6.0 Status RELEASE Page 6 (10)

spring.jpa.properties.hibernate.format_sql

Set to true to log out mysql queries in pretty format. (Effective only when 'spring.jpa.show-sql' is 'true')

· spring.jpa.hibernate.ddl-auto

Auto initialization of database tables. Value must be always 'none'.

· server.address

IP address of the server.

· server.port

Port number of the server.

· domain.name

Set this when the system is available via domain name within the network.

· domain.port

Set this when the system is available via domain port within the network.

· core_system_name

Name of the system. Must be always 'GATEWAY'.

log_all_request_and_response

Set to 'true' in order to show all request/response in debug log.

· server.ssl.enabled

In theory, this property can set to 'false' in order to disable https mode, but in the case the Gateway functionality will not work properly.

· server.ssl.key-store-type

Type of the key store.

· server.ssl.key-store

Path to the key store.

· server.ssl.key-store-password

Password to the key store..

· server.ssl.key-alias

Alias name of the certificate.

· server.ssl.key-password

Password to the certificate.

· server.ssl.client-auth

Must be always 'need' which means that SSL client authentication is necessary when SSL is enabled.

server.ssl.trust-store-type

Type of the trust store.

· server.ssl.trust-store

Path to trust store.

· server.ssl.trust-store-password

Password to trust store.

Version 4.6.0 Status RELEASE Page 7 (10)

· disable.hostname.verifier

If true, http client does not check whether the hostname is match one of the server's SAN in its certificate.

The logging configuration properties can be found in the log4j2.xml file located at src/main/resources folder.

Note: During the build process this file is going to be built into the executable jar, but it is also possible to override it from by an external file. For that use the following command when starting the system: java -jar arrowhead-gateway-x.x.x -Dlog4j.configurationFile=path-to-external-file

• JDBC_LEVEL

Set this to change the level of log messages in the database. Levels: ALL, TRACE, DEBUG, INFO, WARN, ERROR, FATAL, OFF.

CONSOLE_FILE_LEVEL

Set this to change the level of log messages in console and the log file. Levels: ALL, TRACE, DEBUG, INFO, WARN, ERROR, FATAL, OFF.

· LOG_DIR

Set this to change the directory of log files.

Version 4.6.0 Status RELEASE Page 8 (10)

3 Services

Table 1: Services produced.

Services produced	Scope	Published
echo	Application + Core Systems	no
gw-public-key	Gatekeeper Core System	yes
gw-connect-provider	Gatekeeper Core System	yes
gw-connect-consumer	Gatekeeper Core System	yes
gw-close-sessions	Workflow Choreographer Core System	yes

Table 2: Services consumed.

Services consumed	Interface
-	-
